

ELResolver cannot handle a null base Object with identifier

`ignore="true"` is used when an object can be null:

```
1 <put-attribute name="displayedTitleShortInfo" cascade="true" expression="${problem.title}"/>
2 <h1><tiles:insertAttribute name="displayedTitleShortInfo" ignore="true"/></h1>
```

As seen above, we defined Tiles tag named as `displayedTitleShortInfo`. The expression attribute of this tag contains jsp expression. When problem variable is null, we encounter runtime-exception: `ELResolver cannot handle a null base Object with identifier`

To solve this problem, `ignore="true"` attribute must be used.
