

How To Break Foreach Loop in JSP

Jsp Page

In Jsp, there is no **break** element to break foreach loop, so we have used **begin**, **end** and **var** attributes. When **parentPage** is null, then **count** variable will be set to **end** attribute value to break foreach loop as follows:

```
1 <section class="in_sec_nrd">
2   <article class="art_loop_nrd">
3     Where I am:
4     <c:forEach begin="0" end="100" var="count">
5       <c:if test="{not empty parentPage}">
6         <a title="{parentPage.title}"
7           href="{c:url value="/content/{parentPage.url}" />">
8           {parentPage.title}
9         </a>
10        >
11        <c:set var="parentPage" value="{parentPage.parentPage}"/>
12      </c:if>
13      <c:if test="{empty parentPage}">
14        <c:set var="count" value="100"/>
15      </c:if>
16    </c:forEach>
17
18    <tiles:insertAttribute name="title"/>
19  </article>
20 </section>
```

Css

```
1 .in_sec_nrd {
2   width: 100%;
3   float: left;
4 }
5
6 .art_loop_nrd {
7   width: 100%;
8   float: left;
9   padding: 0 0 10px 0;
10  color: #7b7b7b;
11 }
12
13 .art_loop_nrd a {
14   color: #307d71;
15 }
16
17 .art_loop_nrd a:hover {
18   text-decoration: underline;
19   color: #e6352a;
20 }
21
22 .art_loop_nrd p {
23   color: #2B2B2B !important;
24 }
```
